Part 5. Interaction Planning

Group 3

Principles

Interaction lets Natalia choose what to see, but every action has a cognitive cost. We added only interactions that serve her seven questions, followed Shneiderman's mantra and gave each one a keyboard equivalent.

#	Interaction	Course type	Mantra step
I1	Hotel filter	Manipulation: filter	Zoom and filter
I2	Year filter	Manipulation: filter	Zoom and filter
I3	Filters kept between screens	Exploration: navigation	Overview first
I4	Reset filters	Manipulation: filter	Zoom and filter
I5	Linked month highlight	Problem solving: linked views	Details on demand
I6	Tooltips	Problem solving: details on demand	Details on demand
I7	Select a country	Problem solving: linked views	Details on demand
I8	Chart / Map switch	Exploration: change of view	Overview first
I9	Sort toggle	Manipulation: order	Zoom and filter
I10	Play the year	Exploration: animation	Overview first
I11	Table view	Problem solving: details on demand	Details on demand
I12	Night mode	Manipulation: customisation	

Interactions between charts

The hotel and year filters (I1, I2) act on all of the KPIs and charts of a screen, and the link to the other screen carries them (I3). The year labels name the partial years, "2015 (Jul–Dec)" and "2017 (Jan–Aug)". A reset button (I4) is always visible. On the main screen, pointing at a month or reaching it with the arrow keys marks it in all of the charts (I5): a rule in the two line charts and an outline in the calendar heatmap, with its values in the filter panel. On the detail screen, clicking a dot, bubble, box or country, or using the list or Previous and Next, selects a country in every chart and KPI (I7); a second click or the "No country" button clears it. A country outside the top 10 is added at the top of the country charts. The selection is shown by a band, a bold label, an outline and stripes, never by colour alone.

Interactions inside each chart

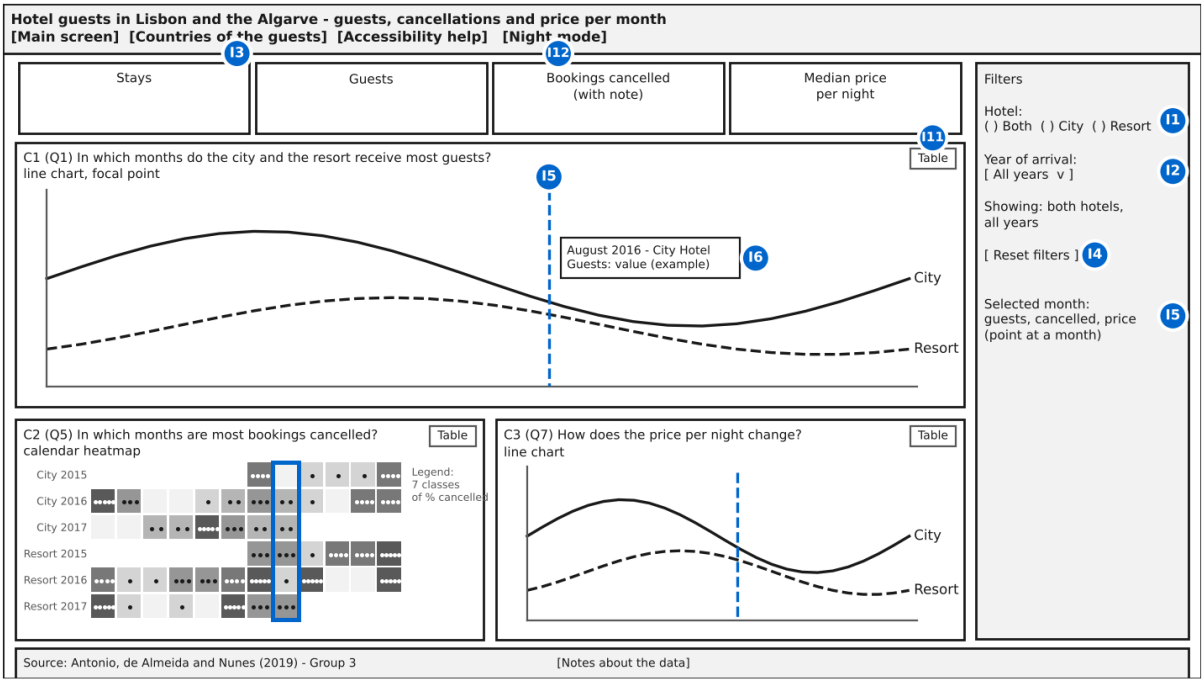

Tooltips (I6) give exact values with units, also for a mark reached with the keyboard. The sort toggle (I9) orders countries by number of guests or alphabetically. The Chart / Map switch (I8) shows the map in the dumbbell's box, keeping three charts visible. Play (I10) moves the bubbles from January to December; it never starts by itself and has Pause and a month slider. Each chart has a Table button (I11), and night mode (I12) that darkens both screens.

Feasibility

Every chart feature was built in a small Vega-Altair test and compiled to SVG; the switch, tables, reset and links need only HTML. Because each chart is embedded separately, with its own alternative text, selections are passed between charts with a few lines of JavaScript, built and tested in Part 6. Figures 1 and 2 show where each interaction appears.
